Features AutoCAD has dozens of features including feature-based editing, parametric and reverse-engineered design, reverse-engineering, drawing creation and placement, reverse-engineering, drawing linking, layout and design automation, multileader master data design, multileader design review and CAD networking and remote drawing access. Some common features include (but are not limited to): Measurement tools Measurements are represented in AutoCAD via linear, projected and polar measurement systems. Linear measurements include length, width, area, volume and surface area. Projected measurements are represented as linear or rectilinear projected areas. Polar measurements include latitude, longitude and angle. AutoCAD calculates and displays all these measurements in the correct units. Projected measurements are calculated based on the project coordinate system. On a standard 2D drawing page, AutoCAD uses the project coordinate system by default. However, a project coordinate system can be defined within the project system (by double-clicking the project system window on the right side of the Drawing Palette), or if no project system is defined, then the default project coordinate system (using the Project>Define Project Coordinate System menu command) is applied. If no coordinate system is defined, then AutoCAD uses the current view (currently set from the View menu, or by double-clicking the View toolbar button). The measurement units for projected measurements are based on the coordinate system definition and whether a project coordinate system is set or not. If the project coordinate system is set, then the unit of measurement is in inches. If no project coordinate system is defined, then the unit of measurement is in meters. Regardless of the unit of measurement, the displayed measurement is in numerical values. When a measurement is defined, the measurement is automatically displayed in the Measurements palette on the far right side of the drawing window. The Measurements palette displays the current measurement, which can be changed to another by double-clicking on the item's name. For more information, see Measurement system. Views AutoCAD provides many views for ease of use. Views are similar to Windows window and Windows Explorer views, where each view can display

different objects and information on the drawing. Attribute fields The Attribute Fields menu provides a number of attribute fields that are useful for customizing the appearance of certain objects, as well as useful for performing custom operations. Some of the attribute fields include: Attributes, a1d647c40b

(video: 1:15 min.) Support for new Microsoft Windows and Mac operating systems, macOS Mojave and Windows 10. Linked Data: Make it easy for your users to discover and explore your linked data or linked data. Display and format it with almost any data type in the drawing, even XML and shapfile. Embedding: Extend the possibilities of drawing objects to automate processes, link the design with project information, or embed documents. Live Linking: Connect, and automatically refresh, any table or feature in your drawing to a table or attribute in an external database. User-Defined Layer Styles: Create unique styles from a block or symbol, and apply them in your drawing with a single click. Faster Path Rendering: Analyze and optimize your drawing paths so that paths are rendered faster in 2D and 3D views. Mixed Precision Arithmetic: Process drawing geometry with both single and double precision to produce accurate results. More image processing tools: Use filters to extract or modify features from an image. Extend your workflow in more ways with templates. Slice and Dicer: Extend your drawing capabilities with interactive shapes to help you slice or dice your drawing. New CAD Tools in AutoCAD LT 2023 Toggle Inline Profiles: With the new Toggle Inline Profiles tool, you can switch between drawing and profile views easily and view the same drawing at multiple scales. You can also switch between viewing just the drawing and just the profile, or display a single view at multiple scales. Content Aware: This new tool uses content-aware features to automatically adapt to the content of drawings. This includes adjusting the scale of displayed objects, reducing the number of components that appear in the drawing, and providing more room around the edges of objects. Extracting Lines from Symbols: This new tool uses an algorithm to automatically extract lines, such as lighting poles, from symbols in drawings. Off-Canvas Snap Method: Use the new Off-Canvas Snap Method to toggle between 2D and 3D views. Query Text: A new tool for querying drawing objects. The Query Text tool allows you to return all objects in the drawing that contain text in their names, descriptions, text styles, or text content
