Q: Cannot access Class level variable inside the constructor I'm trying to make a simple producer consumer pattern in c#. But, I'm stuck with trying to access my data List from the constructor. public class ProducerConsumer { private List data = new List(); public ProducerConsumer() { data.Add(1); data.Add(2); data.Add(3); data.Add(4); } public void Consume() { Console.WriteLine(data.Count()); } } When running the program I'm getting this error: 'ProducerConsumer' does not contain a definition for 'data' and no extension method 'data' accepting a first argument of type 'ProducerConsumer' could be found (are you missing a using directive or an assembly reference?) I'm guessing that this is the simple part of my code. How can I access my data List in the Constructor? A: Constructors can't access fields, nor can classes be initialized in the constructor. It should be something like this: public class ProducerConsumer { private List data = new List(); public ProducerConsumer() { data.Add(1); data.Add(2); data.Add(3); data.Add(4); } public void Consume() { Console.WriteLine(data.Count()); } } List of MPs elected in the 1931 United Kingdom general election
