Dextromethorphan  
overdose. To review the  
pharmacology, metabolism,  
pharmacokinetics,

---

toxicology, clinical pharmacology, and management of dextromethorphan overdose. Articles published from 1966 to March 2001 were located using MEDLINE and Index Medicus searches. Key words used in the searches included dextromethorphan overdose, toxicity, management, and treatment. Articles that provided basic information

---

on dextromethorphan were not included. All studies pertaining to dextromethorphan toxicity in adult patients were selected, and available studies in children were also reviewed. A wide variety of ingestions were reviewed, including intentional overdosages. The data were compiled and assessed for completeness of the information and the overall conclusions. Although

---

the oral route of ingestion is common, repeated dextromethorphan overdoses can also be achieved via other routes, including by inhalation and rectal administration. Toxic symptoms can include convulsions, delirium, coma, hallucinations, seizures, tachycardia, hypertension, bradycardia, hypotension, hypothermia, and death. Severe dextromethorphan

---

overdose can cause seizures and prolonged QT interval, particularly in patients taking other drugs that prolong the QT interval. In patients with known cardiovascular disease, dextromethorphan overdose should be treated like a drug overdose. Reversal of the effects is not possible, but patients with cardiorespiratory arrest should be given the maximal resuscitative measures,

---

including cardiopulmonary resuscitation. The prognosis is usually good, with treatment. Milder effects can be treated conservatively. Dextromethorphan overdose is a potentially lethal situation that can be treated successfully with early hospitalization, intensive monitoring, and supportive therapy.

Q: How to download data from Google Cloud Memorystore without going

through Datastore? This is the first time using Cloud Memorystore and not sure how to debug an issue regarding Python client. I'm trying to download a sqlite3 database in Google Cloud Memorystore and I've been using this python client (see code below). However, it appears that the client fails to download the data from Cloud Memorystore (I get the following error: requests.exc

Combat 4. ![Top: strain calculated at peak of the second harmonic in the (111) reflection of the LNO, using the strain components given in Table 1, in the cases of single and multiple domain configurations.

Middle: difference between single and multiple domains, as a function of wavelength, for the same material and conditions as the top figure.  
Bottom: difference between

single and multiple domains,  
for four different rods,  
representing rods with  
different cross-sections, for  
the same material and

The label “multiple domains”  
refers to the case  
corresponding to the top  
figure, with the addition of a  
second rod as the domain.  
The labels “single domain”,  
“multiple domains for rod 2”  
and “multiple domains for

Discussion =====

As mentioned in the introduction, Mössbauer spectroscopy is not generally adopted in the evaluation of

---

critical straining of materials, owing to the fact that it is a \*nonspectroscopic\* method. Our work shows that one may find a suitable compromise by using the second harmonic of an acoustic pulse to measure the strain gradient when a Mössbauer-like spectroscopy can be applied. The second harmonic will oscillate at twice the frequency of the fundamental acoustic pulse,

---

so that both components of strain can be easily measured and that the strain gradient can be identified. The use of a Mössbauer-like spectroscopy also means that the combination of experimental with theoretical results is no longer needed, as it was for the original Mössbauer experiments. A systematic error evaluation shows that strain measurements based

---

on both the fundamental and the second harmonic can be performed with a precision of about 0.05%. The results, that are comparable to the very low sensitivity of the original Mössbauer
