All programs that can run on the PC are not particularly safe when they come to market. It's just a question of time before virus developers find a way to attack your PC and therefore the virus/program that runs on it. The only solution to this problem is to be constantly updating your virus software; update all your programs on a regular basis, and stay up to date with the latest security updates from your internet connection. If you would like to remove your whole OS and start over completely, you should do a full drive data backup before performing a clean installation. Example: A bit of a general info about what a full drive image backup is Full image backup and restore Usually when you carry out a fresh install of the same operating system as the one you had previously, you start from a clean install and if things don't work out correctly, you have to reinstall your operating system. If you change your mind, you have to first install the fresh operating system and then afterwards, perform a drive image backup to store all your current information on a CD/DVD, USB flash drive or another similar storage media. Full drive image backup saves your all information from the entire hard drive or storage media into a single image file, which is then stored on a different media for later use if you want to perform a clean install of the same operating system. Every time you create a full image backup, your backup is called a complete system image. What are the benefits of a full image backup? It allows you to recover the original system settings, themes, applications, data, etc. You can perform a full data or image backup on the same storage media (hard disk, pen drive, USB key, etc.) where the operating system is installed It is easy to perform a full data or image backup as it requires a few clicks only You can perform a full data or image backup on any storage media such as hard drives, pen drives, USB keys,
