Photoshop is also used to create vector images. Because these vector images are created in an application other than Photoshop, they can be scalable and can be edited in the same way as a raster image. Adobe layers Photoshop layers act in much the same way that drawing layers do in other drawing programs. When you create a new image in Photoshop, you can add one or more Photoshop layers. Each layer has the ability to be overlaid with other layers to create composites. In Figure 12-1, I have two Photoshop layers: the text layer in the upper-left corner and the new layer in the lower-left corner. Photoshop layers can be created in a few ways. Here's the basic workflow for creating layers: 1. Press Ctrl+Alt+N (⌘-Return) to create a new layer. The active layer is now at the bottom of the stack, so the new layer is at the top. 2. Press Ctrl+G (⌘-G) to insert a new layer from a selection made in

the previous step. The new layer is created on top of the previously active layer and continues in the top position of the list. 3. Press Ctrl+Layer in the Layers panel. This function creates a new layer by default, but you can use the pop-up menu to create any layer. To remove the active layer, click the layer below the active layer in the Layers panel. In this case, I'm on the last layer in the list, so I need to click the Delete (trash can icon) button. Photoshop layers are very flexible. For example, you can move layers up and down in the stack. You can also combine layers with each other to create effects such as posterization (see Figure 12-2). **Figure 12-1:** Photoshop layers can be arranged and rearranged as needed in your image. **Figure 12-2:** You can create objects from multiple layers and layer groups to create complex composites. Any active or invisible layer can be transformed — that is, resized, rotated, and flipped in any way. You can also alter the

background color of any layer. If you click the foreground color icon (top-right corner of a layer), you see the foreground color. Select one of the color choices in the color panel and that color is used for

Once again, we could have used an invitation from the Obama administration like the one we received on September 21, 2003, in advance of the invasion of Iraq. Here, President Bush took the opportunity to present to the nation's leaders in Washington the case for war. The president and his cabinet said such an attack would save lives, protect the

nation's security, and bolster the nation's strength. Bush said the ouster of Iraqi dictator Saddam Hussein would unleash the might and generosity of America to the world, and that it would "make our nation safer, make the world a safer and better place for our children, and make America stronger in the process."

America has suffered far fewer casualties in the invasion and occupation of Iraq than has the rest of the world. We have suffered more casualties than all other members of the United Nations combined. Had our government not led us to war, the bulk of the world's present casualties in this conflict -- in Syria, Libya, and elsewhere -- would have been a lot more like World War II than they are. For years to come, we will pay a heavy human and financial price for the war. The administration calls it a success -- but we are still paying a price for that war. When we look back on this war, we shall remember those who came to our shores to warn us of the very dangers we have now

faced. We are still paying the price for those who came to our shores and warned us of dangers we did not want to confront. Some of those warnings still sound alarm bells, as our current leaders remind us. These warnings will be remembered when we look back on this conflict. If we do not heed them and if we do not heed the lessons of World War II, then we may need to return to the war-making methods of our past. The teachings of world history are available on hundreds of websites around the world. I urge you to read more than your daily newspaper and tune in to the real news on cable or on radio. There is so much to read, so much to see, and so much to hear. High level production of pharmaceuticals by filamentous fungi.
