Technical InformationsQ: Minimizing cloc count for Java bytecode I'm working on a project using Restlet. The source code is about a million lines long and includes a ton of classes. I'm trying to find a way to sort this by class count, but the cloc result is huge (12M). Anyone know how to bring it down to the 10's of thousands? Thanks, Rob A: Try "find/grep -lrrestlet.{class|hierarchy}" - it should find all files that include restlet. Have a look at the resulting output, and filter out the files you don't want to analyze. 1. Field of the Invention The present invention is directed to an apparatus and method for measuring the magnitude of a body of fluid and more particularly to a device for measuring the static head of groundwater in a borehole for purposes

of determining the quantity of water to be applied to a land area for recharge or irrigation purposes. 2. Prior Art Land areas that are irrigated or receive recharge of water from subterranean sources are well known in the art. Most such lands are laid out in geographic contours and farmers are normally allowed to apply a supplemental amount of water to an area to compensate for loss through evaporation or other losses prior to the water reaching the crop. Such traditional planning for an irrigated area has several disadvantages. First, the farmer must rent an agricultural land area or obtain a lease that is dictated in terms of acreage to be irrigated and at what rates. In addition to obtaining such a lease, the farmer must plan for the land area he is going to use. An existing irrigation ditch, ditch or canal with only sufficient flow to satisfy the farmer's crop requirements is not always available for use. Further, it is assumed that the quantity of water to be applied is based on "best crop estimates". The available water is then distributed over a land area that is dictated by the farmer's crop requirements and not by any available and suitable recharge or underground water supply. These factors tend to make it more difficult to properly plan for crop production. A need has long existed for a method and apparatus that would allow farmers and other landowners to plan more accurately for crop production. It is also desirable that such a device be capable of indicating to the farmer the amount of groundwater available for use at any particular location.
