There are also many wonderful free or low-cost programs available for both Mac and Windows that enable you to edit photos and customize them for the Web, but they differ in their interface and capabilities. Nevertheless, Photoshop remains a very powerful tool for image creation and editing that today is the tool of choice for many photographers. Photoshop was a product developed for professionals and those who spend big bucks for software, Photoshop Elements is a product for anyone who may need to edit an image file from a camera, for editing a print file created with a camera or for making minor enhancements to an image file that already exists on a computer. The great news about Photoshop Elements is that it enables you to edit all the files in your image library to create new image files, modify an image, or just to tweak an image until it's just right. For example, if you have an image that you took with a camera and then emailed to someone or posted to the Web, you can first open your image in Photoshop Elements and make changes to the color, tone, contrast, saturation, and so on. Then, you can save those changes as a new image file, which you can then email to that person or post to the Web. You can even email a copy to yourself so you have an image file that you can work on further. Photoshop Elements is

compatible with the.psd extension, but it can also open and edit files saved in.jpg,.jpeg,.png, and.tif formats. This enables you to open and edit files that you have created with your camera and then saved in those formats. More interesting, however, is that Photoshop Elements allows you to open a lot of other image file types, including some that you can create with your own image-editing software, like.psd or.jpg files that you created with Adobe Photoshop or any of the other image-

Lists of people known as the Wanderers Lists of people known as the Wanderers: A comprehensive directory of books, articles, sermons, speeches, and other publications concerning the people who are often designated as the so-called Wanderers of the Bible. The project was begun by Frank Moore Cross as an adjunct to *The Biblical World*. The lists are arranged according to historical and geographical extent, the number of entries and the range of content. Each entry refers to any number of individuals in a particular geographical area. There is also an extensive chronology.

Background and overview Frank Moore Cross, who was born in 1916, is best known as the translator of the fourth and fifth editions of the classic Bible commentary on the Hebrew Bible by Julius Wellhausen. Prior to doing translations, he worked in publishing. He wrote the article for the

[Statins and hepatic steatosis]. Hepatic steatosis is a liver damage characterised by excessive hepatic fat accumulation. It is linked to insulin resistance, but its pathophysiology is yet to be entirely elucidated. Recent studies have shown that statins, which are widely used in primary prevention of cardiovascular events, are able to decrease the risk of hepatic steatosis in patients with insulin resistance. However, these studies are biased by several methodological issues related to the analysis of data.

Q: Numpy partial slice operation to reduce dimension of input array I'm trying to figure out how to perform partial slicing to reduce dimension of input numpy array. Say I have the array `myarray = np.random.randn(4,2)` `myarray[:,0]` will return an array of length 4 containing each row of the original array. My goal is to get an array of length 3, where the last 2 rows of the original array are discarded, leaving

---

the 1st row intact. The output should look like  
`print(myarray[:,3])` [ 0.43155546 -1.5103972 ] or  
`print(myarray[:,2:])` [-1.5103972 0.43155546] I  
tried the following, but it seems it will iterate over  
the same dimension of the array and do  
computation. `myarray[:,2:].T` [ -1.5103972  
0.43155546 nan nan nan nan] A: You can slice 2:  
at the end, and then to make the first three rows  
final output, do - `m,n=myarray.shape` out =  
`myarray[2:,:n-2]` Sample run - In [321]: `myarray`  
= `np.random.randn(4,2)` In [322]: `myarray[:,0]`  
Out[322]: array([[ -2.85039796, -1.64989461,  
1.23598353, -0.33816074], [ 0.576435
