Some of the features of Photoshop are in the Creative Suite, so it makes sense to look at how you can access Photoshop's features by using the Creative Suite: Along with the Photoshop application, the Creative Suite includes a suite of programs for a variety of graphic-design and illustration tasks. Photoshop Elements (PE) is the Photoshop equivalent of the Painter program, with many of the same features as Photoshop. Illustrator, in the Creative Suite, provides features such as vector editing and Illustrator Exchange compatibility. Adobe Acrobat creates vector graphics and is used for page-layout and design tasks, as well as to create PDF files. Adobe Bridge offers a browser that enables you to search and browse all your files from a hard drive or the web, including web page images. SketchUp is a 3D web-designing and illustration program that includes features for laying out 3D objects, and exporting them as images for use on websites. Thanks to video tutorials available on the Internet, anyone can learn how to use Adobe software. These tutorials can be found by using a search engine, clicking the "Forum" link on the Adobe Web site (www.adobe.com/products/creativesuite/ps_products_tutorials.html), or searching Google for "Adobe Photoshop tutorials." ## Creating a New File Photoshop is a bit complicated to use in terms of opening a new document. The most straightforward way to open a new Photoshop document is to click the Open button or press Shift+Ctrl+O (Shift+Apple+O on a Mac). You can also right-click and choose File⇒New, as shown in Figure 2-1. FIGURE 2-1: Right-click to open the Open dialog box. You can change where the Photoshop file will open using the Open dialog box (displayed in Figure 2-1, which appears when you right-click the New Document icon). By default, new documents open in the Photoshop document window, as shown in Figure 2-2. Alternatively, you can choose to load the document into a new blank Photoshop window. Click the dialog box's OK button to save the new document. FIGURE 2-2: Load your new document into a new blank Photoshop window. Windows users can use the Save As command to get the same effects. Select the New icon at the top of the

As a non-computer programmer, I'm not going to present a tutorial, but we're going to run through some common photo editing tasks and discuss how to perform them in Photoshop. You can find out more about Photoshop at www.adobe.com/photoshop. Step one: Choosing which images to edit Open your image of choice in Photoshop. Let's first create a new document. Start by hitting New on the Mac or Ctrl + N on Windows. Now your Mac or Windows computer will ask you for your username and password. Drag and drop your files into Photoshop. Step two: Merging multiple images This is the process of combining one image into another, or a series of images into one large image. Here is a photo of a horse. You will need to merge multiple images into one image To merge multiple photos: Duplicate your image. Select the duplicate layer in the Layers panel. Select the original photo. Use the Move Tool. Drag the original layer over the duplicated layer. Release the mouse button. The original photo will be joined to the duplicated layer, but it will retain its own original layer. You can resize the photo using the Resize tool. This process can be quite challenging if you're not paying attention to what you're doing. Let's take a look at a better example. Let's start by Duplicating this horse. Duplicate the image and now we'll merge them together. Here is the original image. To merge multiple images: Open both images and duplicate the horse image. Select all three layers. Select the top layer (the original photo). Select the middle layer (the horse). Move

the horse layer above the duplicate (original) layer and use the Move Tool to align the layers. Select the duplicate layer and use the Resize tool. Use the keyboard shortcuts Ctrl + T (Mac) or Ctrl + F (Windows) to transform the layer. Step three: Using Actions to repeat tasks An action is a macro or sequence of steps that is performed automatically whenever a specific set of conditions are met. You can use an action to automate tasks. For example, you could create an action that 05a79cecff

Stretching is a necessary part of training a dog to run. The dog stretches from its natural gait to the over-distance of what it feels comfortable running on. So, for the dog to run the full length of its body on a treadmill, it must be lengthened. I do it a few different ways and which one is the best is based on your specific dog. By making sure that the dog is on a solid surface and having them be on lead, it's best to take them out to the yard where the dog is confined to its usual running pace. This is to give the dog the opportunity to change speeds without jumping off the treadmill. As soon as the dog jumps on the treadmill a different speed can be set which allows the dog to adjust to that change. Once the dog is settled into the new speed, the trainer can set up a run, giving the dog the time to complete the run. About 60 percent of training time is devoted to teaching the dog to run, with the remaining 40 percent devoted to slowing the dog down or teaching the dog to stop. Running with a Dog When the dog gets to the end of the run, it is instructed to look back (not yet) and to sit or lie down so that it can be handled. Obviously, running with a young pup or dog is not the same as running with a mature adult. Adolescent dogs tend to have longer legs which needs to be stretched to accommodate all that stride length. This is the reason that I use a crossover to teach my dogs. A cross between a hill and a treadmill allows the dog to go longer than expected or any other device. For a young dog, it will allow it to run until it is at a pace where it is panting. While that may be exhausting for the dog, it isn't dangerous. A 60- to 90-minute running session on a treadmill is a good thing for a puppy or adolescent dog. A young dog typically doesn't have the endurance to just sit and take it in stride. Not all dogs should be bred to race. Dogs that are bred to run should be assigned a speed within the range of 15 to 25 mph. Knowing Your Running Dog Knowing how your dog runs can help determine which exercises you use to teach them. As an example, a dog that has

Big Bang-41: Oh Yes, there is actually time Travel, in my early youth I watched the famous time travelling man, whenever I see him, I feel the real stumpeed! Loved all his movies, especially the Big Bang theory- that was awesome! Anyway, back to the topic of time travel. I am currently conducting research on the history of time travel, i'm currently looking at time paradoxes, the infamous grandfather paradox, if you were to kill your grandfather, how would you react and what would happen to your family. I have also looked at time travel on a molecular level, how does it work on a molecular level, the conundrum. and how would it be possible to travel to the past with molecules, or into the future with molecules. Also, there seems to be another paradox involving time travel with recollision, recollision occurs when a light particle interacts with a photon and sends it on a different path, this new path is a little bit longer than the original path due to gravitational attraction, hence there is a recollision, what happens next is not clear, my thoughts? For the concepts of 'Big Bang' and 'Inflation' I will send you to the Dictionary.com definitions: If someone has one sentence and he gets the definitions, then he's got a good chance at a good sentence, maybe, because it works better than if they get the definitions, but I will try to help anyway. "Big Bang": The theory that the universe was created by a sudden burst of energy just like the huge blasts from exploding stars or supernovae; during this blast, the universe expanded and cooled from nearly infinite temperatures (10-34 degrees C) to the temperature of empty space. "Inflation": A theory of the origin of the universe which assumes that space itself is expanding faster than the speed of light as it unfolds to cover an ever-larger part of space. It is based on the discovery that in the early universe the expansion of space was so fast that very small regions were at infinite temperatures and were subject to huge inflationary pressures. "Grandfather

Paradox": If a time traveler changes the past, this means that there is a time line that has been changed, meaning that the travelers grandson has been born before the traveler's grandson is born. There are two possibilities: In this case, the traveler (the grandfather) does travel to the past, because his original
