Shadows are a common background effect in web and print design. You can create nice looking shadows using the Gradient Tool, a drawing pen tool. Effects include all of the effects you would use to alter an image, like blur or photo filter effects. Photoshop offers great support for PDFs (Portable Document Format) and is the go-to tool for people who need to open, edit and print standard PDF documents. Styles can be applied to groups of layers. For example, if you have a group of layers, each item in the group can have different styles. Styles are most effective if you use a program like

InDesign. For non-designers, you may wonder why you might want to work in Photoshop rather than the more basic GIMP (GNU Image Manipulation Program). If you're a web designer, Photoshop is a must; you need to know how to create layers and edit the various layers in Photoshop.

Raspberry Pi, GPIO, and MQTT - and how to read the data!

In this 3-part series I will explain the basics of Raspberry Pi, GPIO, and how to use MQTT for input/output data from devices. I've been exploring the world of Raspberry Pi and I am now familiar with the Pi3 (Model B). Having a little understanding of electronics and microprocessor (flashed with Arduino) I decided

to explore the world of Raspberry Pi and the GPIO (General Purpose Input Output). This is great because we can communicate to the computer (Raspberry Pi) via GPIO pin (interface). This will be very useful for the learnings I have planned for my future! So, let's get started! GPIO overview

GPIO is a digital interface that allows us to send commands to the Raspberry Pi. For example, you can connect a LED to one of the GPIO pins. When you send a specific signal to the pin, the LED will light up. All the digital pins have an interface for the current and voltage. The Raspberry Pi has a set of pins for input and output. You can connect whatever you like, even

LEDs to the pins (besides the set of pins provided). Here is a picture of the interface of the GPIO pins, click for full view. I have prepared a small tutorial on how to use the Raspberry Pi and general purpose input and output (GPIO). You can access it through this link. [Raspberry Pi](#)

Autophagy activation as a target for cancer treatment: an overview. Autophagy is a process that allows cells to degrade and recycle their own components. Although its physiological role is to maintain cellular homeostasis, excessive or defective autophagy can lead to

severe disorders such as neurodegeneration, cancer and diabetes. Accordingly, a dysregulation of autophagy is observed in cancer and, therefore, autophagy is recognized as a potential target in the treatment of cancer, and an activator of autophagy is a promising tool in cancer therapy. In this review, we highlight progress in the development of activators of autophagy for cancer therapy, particularly in the field of chemotherapy. We describe the background of autophagy, the most critical steps, different kinds of autophagy and their effects on different pathological states, and we summarize strategies and

early clinical trials to activate autophagy in cancer therapy.// //
