The present invention relates generally to metal forming processes, and more particularly to metal forming processes utilizing ultrasonic energy. Machining techniques have been used for many years to cut, shape and/or form metals. A wide variety of materials may be machined, including metals, synthetic materials, composite materials, and even biological materials. Ultrasonic machining, for example, is well known in the industry. In general, this process involves the use of a high frequency energy source to vibrate a tool, which contacts the workpiece. The vibrations cause the tool to perform cutting operations on the workpiece, and may also perform forming operations on the workpiece. During these operations, the tool is at least partially submerged in a machining fluid, which may be a coolant or lubricant. Ultrasonic machining may be used to machine the workpiece by the combination of

the cutting and forming actions of the tool, and the high velocity, ultrasonic motion of the tool. In a typical ultrasonic machining operation, the workpiece is clamped or otherwise held down on a surface, such as a work table, by one or more clamping means. The tool is also clamped or otherwise held in position. A mechanical part of the tool is attached to a transducer, which is electrically driven at high frequency, typically around 40 kHz. af5dca3d97
