I am running a server with neo4j graph database (v3.2.0). I am trying to save the database so that it is in read only mode. I tried using the Neo4jClient from the neo4j-wrapper-async API. public async Task SaveGraphAsync(GraphDatabaseService database) { if (database.IsReadOnly()) { //success } else { throw new Exception("Database is already in readonly mode."); } return true; } I am using this approach even though I have now realized that the neo4j-wrapper-async API does not support this. I simply want to be able to save the database to the filesystem (or docker volume with Neo4j 3.2.0) so that I can restore it for a single user in a test environment. If the database is in read only mode then it will be perfect. The first step is to get the Neo4jClient to save the database. After that I can figure out what to do with the connection string, so that it works with single user scenarios. A: Stuff has changed since the documentation was written. You can now call SaveDatabase. A: EDIT: my previous answer is incorrect - use the new SaveDatabase(GraphDatabaseService database) method. What you're seeing is the behaviour of the wrapper classes you've used so far. Neo4jClient exposes methods for all of the newer lower-level graph APIs (cypher, REST, HTTP, Json,...) and it looks c6a93da74d
