There are examples of clustered prefix search with simple storedValue, but I cannot find examples for clustered search with storedValue with geode clusters (glossary). Is it possible to do a clustered search with storedValue? A: Clustered search by default assumes the leaf nodes have their own individual index range and search splits them to the correct shards - so no, it's not possible to use the standard range of the index with distributed queries. As long as the correct shards are selected the results will be distributed across the clusters and the final geode execution can make sure the range is correctly joined from one cluster to the next. Q: Multiply of matrices with automatic indexing Is it possible to run a matrix multiplication with some kind of automatic indexing? I have an array of matrices, and I would like to run matrix multiplication over them. This is an example of what I would like to do: > x = magic_function[num] > d = [[x], [y], [z]] > m = [[a, b, c], [d, e, f], [g, h, i]] > result = [a*d, a*e, a*f, b*g, b*h, b*i, c*g, c*h, c*i, d*e, d*f, d*g, d*h, d*i, e*g, e*h, e*i, f*g, f*h, f*i,...]
